

1.0 Introduction

1.1 Introduction on Mercury and Venus

Tools Used

In this project, our group selected Microsoft PowerPoint over Canva as our primary multimedia authoring tool. While Canva is beginner-friendly and has a lower learning curve, PowerPoint offers advanced capabilities and more customized animation options. These features give us greater control over the multimedia elements, enabling us to integrate them seamlessly. By using PowerPoint, we were able to combine all multimedia components effectively to produce our Space Documentary.

During the preparation of the multimedia elements, images, audio, and video were obtained from YouTube and Pinterest using the Google Chrome browser. These platforms were selected because they provide a wide variety of accessible multimedia resources, and Chrome made it possible to download and manage them efficiently. The Photos app in Windows 11 was used to refine and crop the collected images, while Microsoft Clipchamp, which also comes preinstalled with Windows 11, was utilized for video editing. By using these tools, this enabled the refinement of the media so that it suited the intended theme.

Editing Process

After gathering the materials, the materials need to be refined and adjusted to fit the presentation slides. This ensures the content is clean and clear to let the audience understand easily.

For **images**, the Photos app was used to refine the pictures downloaded from the web. This photo editing application provided features such as cropping images to the desired size, adjusting the lighting, and even removing backgrounds. According to Figure 1.1.1, the background of the grey carbon dioxide smoke image was removed with a simple click. By removing the background, the image does not cover the main subject, allowing it to integrate seamlessly with other visual elements on the slide. To create a darker appearance, adjustments can be made in the Light adjustment pane by lowering the brightness or exposure, and by increasing the contrast, as shown in Figure 1.1.2.

Figure 1.1.1 Picture editing for removing background

Figure 1.1.2 Picture editing for the light adjustment

Looking at the **video** aspect, Microsoft Clipchamp is utilised due to its comprehensive set of editing features, including trimming, splitting, audio integration, visual effects, and colour adjustments, which enhance the overall quality of the video. Based on Figure 1.1.3, after importing the video, the crop option can be selected to adjust the frame and focus of the video. On the editing timeline, the timeline indicator is positioned at the desired point, and the split function is used to divide the video into separate segments for further editing. After that, the unnecessary segments are removed, and the export button is selected. This produces a trimmed video that includes only the relevant parts.

Figure 1.1.3 Video editing

Similar to the **audio** element, Microsoft Clipchamp can be used to refine audio by removing unwanted sections and retaining only the necessary segments, as shown in Figure 1.1.4. This allows the final presentation to maintain clarity and focus, ensuring that the audience hears only the most relevant content.

Figure 1.1.4 Audio editing

In addition, Microsoft PowerPoint will be used to integrate all refined multimedia elements, following the storyboard that has already been completed. After arranging the content, animations and transitions can be added from the Animations tab based on Figure 1.1.5. The Add Animation button allows multiple effects to be applied to a single object, while the Animation Painter can be used to copy animations from one element to another for consistency. The overall animation flow can be viewed and managed in the Animation Pane, which provides a clear timeline of all effects applied to each slide element. To manage which pictures or objects appear on top or behind others, the Selection Pane in PowerPoint can be used, as shown in Figure 1.1.6. This tool allows user to reorder objects, making it easier to organize and control overlapping elements within a slide.

Figure 1.1.5 Audio editing

Figure 1.1.6 Selection Pane

1.2 Introduction on Earth and Mars

Tools Used

To create a cohesive “Space Documentary” experience, our group utilised Microsoft PowerPoint as our primary multimedia authoring tool. While simpler platforms like Canva offer ease of use, PowerPoint was selected for its advanced interactive capabilities and granular control over object-level animations and transitions. This was essential for synchronising complex visual and audio sequences such as planetary rotations and atmospheric reveals, ensuring that each member’s contribution felt like a single, continuous journey through space rather than a collection of isolated slides.

Editing Process

Our workflow followed a “Master Template” approach to maintain visual uniformity across the entire presentation:

Cinematic Void

We established a shared solid black background with a consistent star-field density to act as a visual bridge between different planets, ensuring no jarring transitions between speakers that would take the audience out of the immersion. Figure 1.2.1 shows one such example.

Figure 1.2.1 Dark Background with Stars

Typography and Legibility

We implemented a standardised colour palette, the Flexoki colour palette (Figure 1.2.2 and Figure 1.2.3); it is an inky colour scheme that is designed for reading and writing on digital screens. As opposed to harsh whites on black or vice versa, the reduced contrast provides a more comfortable reading and viewing experience for the audience, preventing Halation.

Color	Hex	Light theme	Dark theme
black	#100F0F	tx	bg
base-950	#1C1B1A		bg-2
base-900	#282726		ui
base-850	#343331		ui-2
base-800	#403E3C		ui-3
base-700	#575653		tx-3
base-600	#6F6E69	tx-2	
base-500	#878580		tx-2
base-300	#B7B5AC	tx-3	
base-200	#CECDC3	ui-3	tx
base-150	#DAD8CE	ui-2

Figure 1.2.3 Flexoki Accent Colours

Transitions and Animations

Each planet is set to float in and out of each slide, taking the audience on a journey from one planet to another, further exemplifying the experience of travelling through space. Each transition and animation is done with the built-in feature found in Microsoft PowerPoint as it already provides sufficient granular, complex, and flexible control over the animation of specific objects, eliminating the need to use other tools. As shown in Figure 1.2.4 and Figure 1.2.5, Microsoft PowerPoint allows us to select specific objects, their triggers, and their configurations as well as their timeline, allowing us to be selective in our implementation of animations and transitions.

Figure 1.2.4 Morph Transition Earth and Mars Before

Figure 1.2.5 Morph Transition Earth and Mars After

The features that Microsoft PowerPoint provides for transitions are extended to animations, whereby the same granular control is provided to us; we can apply animations to specific objects, control their duration and triggers, as well as controlling the order of animation (Figure 1.2.6 and Figure 1.2.7).

Figure 1.2.6 Animation Panel

Figure 1.2.7 Path Animation

Audio

The audio sound effect was installed for free from Pixabay as shown in Figure 1.2.8 and then inserted into Microsoft PowerPoint (Figure 1.2.9).

Figure 1.2.8 Audio Downloading

Figure 1.2.9 Inserting Audio

Figure 1.2.10 Audio Configuration

1.3 Introduction on Jupiter and Saturn

Tools Used

Several tools were used to develop the presentation slides. First, Slides Carnival was used to find for a suitable template and the “Morph Space-Themed Background Slide” was chosen. This template was selected because it fits well with the space theme and features various planets while making it visually relevant to the topic. Besides, Microsoft PowerPoint was used to further edit and refine the slides. It

was chosen for its convenience, user-friendly interface, and accessible features which made it easy to use even for someone without a strong technical background.

In addition, all relevant images were sourced from Google, Pixabay, and the official NASA website. For example, the rotating Jupiter video was obtained from NASA to ensure the use of authentic and real-world media rather than synthetic content. Furthermore, the audio elements were downloaded from YouTube. For instance, space environment sounds related to Jupiter's rotation were downloaded via Youtube to enhance the presentation and give the audience a more immersive experience of space.

Editing Process

During the editing process, Microsoft PowerPoint was mainly used. For example, the solar system image was provided by the presentation template as shown in Figure 1.3.1. The **image** was then cropped so that each planet could be animated individually to improve the overall presentation. This cropping was done using PowerPoint's built-in cropping tool and it is shown in Figure 1.3.2.

Figure 1.3.1 Image Inserted into Microsoft PowerPoint

Figure 1.3.2 Image Cropped

In addition, **videos** were downloaded from the internet to enhance the slides. For instance, the rotating Jupiter video was obtained from the official NASA website as shown in Figure 1.3.3. After downloading, the video was successfully inserted into Microsoft PowerPoint which is shown in Figure 1.3.4.

Figure 1.3.3 Video Downloading

Figure 1.3.4 Video Uploaded into Microsoft PowerPoint

For **animations**, Figure 1.3.5 demonstrates how animation effects were added using Microsoft PowerPoint. By selecting the “Animations” tab on the navigation bar, different animation styles can be applied to objects on the slide. Once the animations are added, the Animation Pane can be opened on the right side. The animation pane feature allows the user to organize and control the sequence of

animations. By doing so can ensures a smoother flow and creating a more engaging experience for the audience.

Figure 1.3.5 Animation Added into Microsoft PowerPoint

Moreover, the **video** of Saturn with its rings was downloaded for free from Pixabay as shown in Figure 1.3.6. The video was inserted into the Microsoft PowerPoint. Similar to the previous slide, animations were added to each object. In addition, a “Click Me” button was included to enhance audience engagement. Figure 1.3.7 illustrates the process of adding the “Click Me” button, where a trigger was applied so that when the audience clicks it, a new object appears on the slide.

Figure 1.3.6 Video Downloading

Figure 1.3.7 Animation Added into Microsoft PowerPoint

1.4 Introduction on Uranus and Neptune

Tools Used

Several tools were used during the preparation and presentation process. Microsoft PowerPoint was used to combine all components and elements into a structured presentation, allowing the information to be organized clearly and presented effectively. CapCut was used for video editing, enabling the trimming and cropping of video content to ensure the final video was clear and suitable for the presentation.

Preview was used for basic image editing tasks, such as cropping images and removing background before they were included in the presentation materials. In addition, Safari was used to search for resources from platforms such as YouTube and other websites. It was mainly used to find and download relevant images, videos, and audio materials that supported the content of the presentation.

Editing Process

The editing process involved refining images, videos, and slides to ensure the presentation was clear and visually organised.

For **images**, editing was done using Preview as shown in Figure 1.4.1. Images were cropped to remove unwanted areas and reduce the image size. The cropping area was first selected, and the crop button was clicked to crop the selection. The background of certain images was also removed to eliminate unnecessary areas and enhance the visibility of the main subject by clicking the Remove Background button.

Figure 1.4.1 Image Editing

For **videos**, cropping was performed to enlarge the focused part of the video and ensure that the size was suitable for the presentation slide. The cropping area was selected and cropped using the cropping tool in CapCut, as shown in Figure 1.4.2. In addition, trimming was applied to remove the less important beginning and ending sections of the video so that only the most relevant parts were shown. The timeline indicator was placed at the point where the video needed to be split, and the Split button was clicked to divide the video into two parts, as shown in Figure 1.4.3. The trimmed video was then exported by right-clicking the video and selecting “Export selected clips.”

Figure 1.4.2 Video Cropping

Figure 1.4.3 Video Trimming

For the **slides**, videos, images, and shapes were arranged clearly according to the storyboard. The appearing order and style of each element were organized and selected, and movements and trigger conditions were added using the tools available in Microsoft PowerPoint, as shown in Figure 1.4.4.

The movements were set by adjusting the start and end locations along with the movement direction and style, as illustrated in Figure 1.4.5. Transitions and animations were also included to create a smoother flow throughout the presentation.

Figure 1.4.4 Slides Editing

Figure 1.4.5 Element Movement Setting

2.0 User Interface Design

This interactive PowerPoint presentation focuses on the extraterrestrial bodies within our solar system. Although planets can be classified in a variety of ways, the emphasis is placed on providing intriguing facts about the planets that are most familiar to the general audience. Interesting facts about each planet are presented through digital multimedia elements such as text, graphics, audio, video, and animation to enhance visual impact and improve audience engagement.

2.1 Inner Planets

In this section, the user interface design of the Inner Planets presentation is discussed. The design incorporates five multimedia elements that include text, images, shapes, animations, audio, and video. The explanation highlights not only how these elements were used, but also why specific choices were made for each element. This ensures that the design decisions are purposeful and directly contribute to the effectiveness of the presentation.

2.1.1 Mercury

Text

Sans-serif font, Inter was selected for the text due to its modern and clean appearance. This makes it easy to read on a large screen by the audience. For the titles, a font size of 80 was applied, while facts were presented at size 54 and their explanations at size 32. This hierarchy of font sizes ensures clarity, emphasizes key information, and enhances readability throughout the presentation.

As Mercury comes into view, the slide is introduced with the title as “The Planet of Fire and Ice”. The Mercury video immediately introduces the audience to the planet, while the title sets the context and theme for the discussion. In the title, the word “Fire” was coloured in red, while the word “Ice” was coloured in blue. This colour choice visually represents Mercury’s extreme temperature variation as it is intense heat during the day and freezing cold at night.

For the second fact text, the word “ Temperature” was coloured in both red and blue to draw the audience’s attention and emphasised that it represents both heat and cold. This colour choice is further

reinforced in the explanation, where daytime temperatures are shown in red and nighttime temperatures in blue, clearly illustrating Mercury's extreme temperature contrasts.

For the explanation of the second fact, it describes that Mercury is composed of metallic rock and has no atmosphere to trap heat. This leads to extreme temperature differences on Mercury. The word "rocky" is coloured brown, and the word "metallic" is coloured silver. These colour choices act as visual cues, making it easier for the audience to quickly grasp the meaning. Brown immediately represents the solid nature of rocky planets, while silver conveys the shiny, reflective quality of metallic elements. By using visual cues, the audience can gain a quicker and clearer understanding of the explanation. Moreover, the temperatures during daytime and nighttime of Mercury are shown in red and blue respectively. This allows the audience to instantly distinguish between them and better understand the contrast.

Shape

In this slide, a rounded rectangular shape is used to create the "Show Reason" button. This adds an interactive element to the presentation, supporting audience engagement. The button allows information to be revealed on demand rather than all at once. By clicking it, viewers can access supporting explanations step by step, which helps maintain focus and prevents cognitive overload

Furthermore, the circle shapes are used to create the light-chasing effect around the "Show Reason" button. These shapes are used to serve as a visual cue that the button is interactive.

Animation

Every component in the presentation slide was enhanced with animations. This design choice makes the content more dynamic and interesting. Simultaneously, this ensures that information is revealed step by step, which creating a clear flow. By presenting details gradually, the audience is guided through the materials without feeling overwhelmed, allowing them to focus on each piece of information in sequence.

The word "smallest" in the first fact and the Mercury video are both animated with a shrink to 50% effect. This visual technique emphasizes Mercury's status as the smallest planet in the solar system and reinforces the information by pairing text with motion. The shrinking animation not only

highlights the key fact but also creates a memorable visual cue that strengthens audience understanding.

To create the circular light-chasing effect, a custom motion path was applied to the circle shape. This effect gives the design a space theme vibe and visually signals to the audience that the button is interactive. The moving light draws attention to the button, making it stand out from other elements and guiding users toward engagement.

Video

The video of Mercury is displayed at the center of the presentation slide. This placement immediately introduces the audience to the planet. The video allows the audience to better visualize the planet's appearance and creates a stronger sense of realism. Compared to a static image, the moving video captures attention more effectively. It also makes the content more engaging.

2.1.2 Venus

Text

The text “Venus: The Hottest Rebel” acts as the title for this slide. The word “Hottest” is coloured in red to represent extreme heat, visually reinforcing the fact that Venus is the hottest planet in the solar system. This same colour choice is applied in the second fact text, where the word ‘*Hottest*’ also appears in red. Using consistent colour across the slide emphasises Venus’s characteristic and helps the audience quickly associate the planet with its intense surface temperatures. The word “Rebel” describes Venus’s unusual rotation, as it turns in the opposite direction compared to most other planets. The first fact highlights that Venus is the hottest planet in the Solar System, while the second fact shows that the Sun rises in the west due to its unusual rotation

The explanation of the first fact text shows that Venus has a carbon dioxide atmosphere that causes a strong greenhouse effect. This effect traps heat inside the planet’s atmosphere, making the surface temperature rise to extreme levels. By highlighting “CO2 atmosphere” word in grey, the audience can visually connect the concept of carbon dioxide with the explanation of heat trapping. This colour works as a cognitive anchor, helping the audience quickly associate the term with the greenhouse

effect mechanism. For the explanation of the second fact, it shows that Venus spins backwards compared to most planets.

Shape

The “Show Reason” button is designed using a rounded rectangle, introducing an interactive feature that encourages audience participation. Instead of displaying all information at once, the button reveals explanations step by step, which helps the audience stay focused and avoid information overload.

In addition, circular shapes create a dynamic light-chasing animation around the button. This design not only enhances the space aesthetic but also highlights the button’s interactivity. Therefore, the audience’s attention is naturally drawn toward the buttons.

Image

In the slide, a 3D model of Venus is shown alongside three grey carbon dioxide smoke images. The Venus model illustrates the planet’s physical appearance, while the smoke images depict its dense CO₂ atmosphere. This helps the audience understand Venus’s atmospheric composition and also highlights the greenhouse effect.

Moreover, the circle shapes are used to create the light-chasing effect around the “Show Reason” button. This design serves as a visual indicator, highlighting the button is interactive.

Animation

Animations were applied to each element on the slide, making the presentation more engaging and lively. This approach also allows information to appear progressively, creating a logical and clear sequence. When the first “Show Reason” button is clicked, three carbon dioxide smoke images float in to simulate Venus’s CO₂ atmosphere. Upon clicking the second “Show Reason” button, the smoke images gently float out and revealing a 3D model of Venus that rotates to illustrate the planet’s unique rotation.

In addition, the custom motion path that added to the circle shapes create a dynamic light-chasing animation around the button. This design not only enhances the space aesthetic but also highlights the button’s interactivity. Therefore, the audience’s attention is naturally drawn toward the buttons.

Audio

This slide uses a burning sound effect when the first ‘Show Reason’ button is clicked. The sound emphasises Venus’s extreme heat, helping the audience better sense the planet’s intense temperature. In addition, pairing audio with visual effects creates a multisensory experience. This makes the concept more immersive and ensures the audience remembers the connection between Venus and its high temperature

2.1.3 Earth

Text

The font used is a sans-serif font, Inter. Chosen for its modern, clean, and scientific look, it provides excellent readability, especially when presented on a large screen for audiences sitting from a distance. Its lack of taper also provides a clutter-free look, providing sufficient space for images or models to be presented.

To allow the audience to quickly catch the subject of the fact, a giant globe of the Earth is presented on screen, along with its alias “The Blue Planet” with the word “Blue” coloured in blue. In contrast to texts and description, the employment of implicit communication quickly establishes the subject and show that the Earth’s surface is mostly comprised of water, respecting the audience’s intelligence.

In addition, the main fact presented in this slide is that the Earth is a not perfect sphere due to how fast it is spinning. This fact is presented with the title “The Wobbly Life-Giver”. The use of

This title provides two key insights:

- “Wobbly” indicates that the Earth is spinning fast
- “Life-Giver” paints the Earth in a positive, home-like light

The word wobbly is highlighted in amber, providing a visual anchor and ensuring the audience’s eyes go immediately to the core subversion of the myth.

These texts are split into “Headline”, “Fact”, and “Description” with minimal words to avoid cognitive overload, allowing the audience to process both text and visual elements simultaneously.

Image

Images help with visualisation of information and audience engagement of the presentation; an image of oblate sphere is included in the slides to help the audience to digest the information presented

Animation

To keep the volume of texts on the slide minimal, the impact of Earth's rotation speed is presented with a rotating animation of the globe, allowing the audience to have an implicit understanding of the cause of Earth's weird shape. Finally, the Earth's actual shape is also shown with an image as describing with words will only lose the attention and confuse the audience.

Interactivity

Finally, to avoid presenting information too quickly to the audience, the progressive disclosure technique is employed, whereby the image of an oblate sphere is only shown on click of a button. By withdrawing showing the actual shape of the earth, it grows a sense of curiosity amongst the audience, keeping them engaged with the content.

Animation and Audio

The 3D model of the globe is set to spin 360° for the entirety of the slide along with a "whoosh" sound. These two elements are designed to synchronise, further exemplifying the speed at which the earth is spinning.

2.1.4 Mars

Text

The alias used in this slide is "The Rusty Desert", with "Rusty" coloured in orange. Employing implicit communication again, the audience can visualise a dry, red surface of the Mars without textual description. The company of an image of Mars also further facilitates this imagery.

The main fact presented in this slide is the presence of the largest canyon ever recorded in our solar system. This fact is presented with "Home to Valles Marineris", whereby "Valles Marineris" is red in colour to draw the attention of the audience towards the fact. The use of red for the canyon's name creates a thematic link to the rust-coloured surface of the planet, creating a semantic cue to reinforce the subject matter. To further illustrate the size of the canyon, the word "largest" is also scaled up and coloured red.

Similarly, the texts are split into "Headline", "Fact", and "Description" with minimal words to provide room for personal interpretation while avoiding cognitive overload.

Interactivity

A "Bring me there!" button is in the centre of the, indicating that a form of journey onto the surface of the planet will be taken. This not only encourages interactivity, but also entice a feeling of anticipation amongst the audience for the coming slide.

Transition

This fact is presented in two slides; the first slide prepares the audience while the second slide provides a visualisation on the appearance of the canyon. To avoid breaking the immersion, the transition from the first slide to the second slide is made to mimic a zooming effect. The transition utilises progressive disclosure via a morph zoom, maintaining spatial continuity so the audience understands where the canyon is located on the planetary sphere.

Image

In the second slide presenting information about Mars, an outline of the United States of America is placed on the image of Mars. If numbers were used instead, the size of the canyon may be difficult to grasp.

Path Animation

Additionally, since the large scales are often difficult to grasp, an animation of an icon of a person walking through the entire canyon is played as the presenter presents. By using a human walking icon as a relatable unit of measurement, the design translates an abstract astronomical distance into a 'Biological Effort' that the audience can intuitively process.

Audio

To provide a sense of relatability, the slide introducing Mars is accompanied by an audio splice of desert wind blowing throughout the whole slide. This not only provides immersion to the audience, but also provides an intrinsic imagery that Mars is a dry planet, similar to deserts on Earth.

2.2 Outer Planets

This section discusses the user interface design of the outer planets presentation, focusing on how multimedia elements such as text, images, shapes, animations, audio, and video are used. These elements are carefully combined to enhance clarity, improve audience understanding, and create an engaging learning experience. Each component is designed to be relevant to the topic while supporting the overall space theme of the presentation.

2.2.1 Jupiter

Text

Text is used to emphasize key information for the audience. The phrase “Jupiter: The Largest Planet” highlights the main idea about Jupiter. It allows the audience to quickly understand the topic without needing a long explanation. The font used is “Inter” with a size of 80 for the main text and 48 for the

supporting text. In terms of color, light grayish-olive and desaturated orange were chosen. The reason for choosing them is the desaturated orange complements Jupiter's planetary tones and the light grayish-olive stands out clearly against the space-themed background. By doing so, it improves readability for the audience while maintaining a color scheme that matches Jupiter's tones.

Image

Images are used to visualize information. Instead of relying on plain text, adding planet images allows the audience to understand concepts more clearly. When comparing Jupiter and Earth, placing the image of Earth inside Jupiter helps the audience directly see the size difference. This makes it easier to understand compared to describing it only with words which can be difficult to imagine.

Shape

Shapes are used as visual design elements and to enhance clarity and emphasis. A bracket shape is used to highlight that Jupiter is approximately 11 Earths wide. This helps the audience clearly understand the size comparison by visually grouping the Earth images. The shape also guides the audience's attention to the key information without relying solely on text. As a result, the concept becomes easier to grasp and more engaging for the audience.

Animation

Animation in presentation slides helps make the content more engaging and easier to understand. It allows information to appear step by step, so the audience can focus on one point at a time instead of being overwhelmed by too much content at once. For example, when introducing Jupiter, each planet appears one by one. This allows the audience to focus on the animation of the solar system more clearly. Moreover, animating the text also helps capture the audience's attention as the information is revealed gradually.

Audio

Audio is used to capture the audience's attention. Background music or sound effects make the presentation more interesting than silent slides. For instance, the audio of Jupiter spinning is combined with the rotating Jupiter visual. This allows the audience to experience the atmosphere of space better.

This creates amore immersive experience, helping the audience connect with the content on a deeper level.

Video

Video is used to visualize the real-life movement and process which allows the audience to see things that cannot be easily explained with static images or text. For example, a video of Jupiter rotating gives a clearer understanding of how the planet looks and behaves compared to just a Jupiter image. This makes the content more realistic and easier to understand.

2.2.2 Saturn

Text

The text is used as a visual aid in this slide. It helps emphasize the main topic, draw attention and ensure that the audience focuses on key points. The text “Saturn: The 2nd Largest Planet” informs the audience about Saturn’s characteristics. Moreover, the word “Rings” highlights one of Saturn’s most important features and is used to draw the audience's attention to the fact that it is the only planet with prominent rings.

The text is also presented in bullet points which avoids long sentences and makes the information clearer and easier to read. The “Inter” font is used with a font size of 80 for the main text and 48 for the supporting text. In terms of colour, light greyish-olive and desaturated orange were selected as they match Saturn’s colour theme and enhance the overall visual consistency of the slide.

Image

Images also help support and clarify ideas. An image of Saturn with its rings is included in the slides to help the audience better understand what is being described. Additionally, images are used such as dust to represent very small particles and a mountain to represent much larger ones to explain the size variation of Saturn’s rings. By doing so, the presentation becomes more engaging. It also captures the audience’s attention and interest more effectively than plain text alone.

Shape

Shapes are used to guide attention and enhance interactivity. The curved arrow pointing toward Saturn’s rings helps direct the audience’s focus to this key feature. By doing so, it makes the audience clearer what part of the image is being emphasized. This visual cue reduces confusion and allows the audience to quickly understand the importance of the rings without needing much explanation. Besides, a rectangular shape used for the “Click Me” button serves as an interactive element in the presentation. It encourages audience participation by allowing them to click and reveal additional content.

Animation

Animation is also used to improve the flow of the presentation and support interactivity. For the Saturn slide, after the text “Rings” appears, the arrow and the image of Saturn’s rings appear shortly after. This sequence helps guide the audience’s attention and creates a smooth and logical flow of information while making the presentation more engaging and easier to follow.

Video

Videos are used to enhance storytelling and explanation by showing actions over time. For example, a video displaying Saturn’s rings is included to better illustrate their movement and structure. This helps the audience understand the concept more clearly compared to static images. By showing the rings in motion, the presentation becomes more engaging and easier to follow. As a result, the audience can better visualize and appreciate the unique features of Saturn.

2.2.3 Uranus

The user interface of the presentation was designed by carefully integrating text, images, shapes, animation, and video to ensure that the information presented is clear, engaging, and relevant to the topic. The layout and multimedia elements were arranged to guide the audience’s attention and support the explanation of the planet Uranus.

Text

Several text elements were used to present key information. The main title “Uranus: The Gaseous Ice Giant” is placed prominently at the top of the slide to introduce the topic clearly. Important keywords such as “Gaseous” are highlighted in a different colour to emphasize the main characteristic of the planet. Additional text elements such as “One of the Coldest planets”, “Posses 27 known moons”, and “Its blue colour is from Methane” provide important facts about Uranus. The text is written in short phrases instead of long paragraphs to improve readability and allow the audience to quickly understand the key information.

Image

The pictures of Uranus and its moon are included to visually represent the subject being discussed. These images help the audience better understand the appearance and features of the planet. The visual

representation reinforces the textual explanation, especially when explaining characteristics such as the blue colour of Uranus. The images are placed strategically within the slide to balance the layout and avoid overcrowding.

Shape

Shapes are used as part of the interface to highlight interactive elements and guide the audience. For example, the rounded rectangle button labelled “Show Interesting Facts” is placed at the bottom of the slide to indicate an interactive action. Additionally, a right arrow shape is used in another slide to direct the audience’s attention toward the planet and the text explaining the methane composition. These shapes help organize the information visually and improve the structure of the slide.

Animation

Several animation effects are applied to control how elements appear and move on the slide. Text elements such as “One of the Coldest planets” and “Posses 27 known moons” are animated to appear when triggered, allowing the audience to focus on one piece of information at a time. The animations are triggered by the “Show Interesting Facts” button, which allows the presenter to reveal the facts interactively.

A motion path animation is also applied to the arrow shape, allowing it to move horizontally across the slide toward the image of Uranus. This movement visually directs the audience’s attention to the planet while reinforcing the explanation about its blue colour caused by methane. Additionally, a grow animation effect is applied to the image of Uranus to emphasize it and make the presentation more dynamic.

Video

A video of Uranus is embedded in the slide. Including video helps provide a more dynamic explanation compared to static images and improves audience engagement.

2.2.4 Neptune

The user interface design of the Neptune slide focuses on presenting information clearly while maintaining an engaging multimedia experience. Different elements such as video, text, image,

animation, and audio are carefully selected and arranged to ensure that the content remains both clear and relevant to the topic.

Video

A video of Neptune is used as the background visual which introduces Neptune visually and helps the audience immediately recognise the planet. The moving background also makes the slide more dynamic compared to a static image, which helps maintain audience engagement. The video is set to loop until the end of the slide so that the visual motion continues throughout the presentation.

Text

The headline “Neptune: The Windy Ice Giant” is displayed in a large font size to clearly introduce the planet. The headline uses white and blue colours to create contrast with the dark background and to visually relate to the blue appearance of Neptune.

The fact texts present key information about Neptune in short and concise phrases. The first fact highlights “Diamond rain”, while the second fact states that Neptune “Has the strongest winds.” The keyword in second fact is enlarged and coloured blue to emphasize the important concept. Using short phrases improves clarity and allows the audience to quickly understand the main facts.

Image

An image of a diamond is included to visually represent the fact about diamond rain occurring on Neptune. The diamond image is animated to move from the planet toward the text “Rain.” This custom path animation visually demonstrates the concept of diamonds falling through Neptune’s atmosphere. The grow transition slightly enlarges the diamond to emphasize that the diamond is small compared to the size of the planet while still drawing attention to the visual representation of the fact.

Audio

The slide also uses audio, specifically a wind sound, to enhance the atmosphere of the presentation. This sound effect represents the extremely strong winds found on Neptune, which are known to be the fastest in the Solar System. The audio is set to play and loop until the end of the slide, allowing the audience to experience an immersive environment that supports the visual and textual information.

Animation

Animations are used to control how elements appear on the slide. The headline dissolves in smoothly, while the fact texts fly in sequentially to present the information step by step. This prevents the slide from appearing too crowded and helps guide the audience's attention gradually. The appearance and motion of the diamond image further strengthen the connection between the visual element and the textual explanation.

3.0 Storyboards

3.1 Storyboards for Mercury and

3.1.1 Mercury

Headline: Mercury: The Planet of Fire and Ice

Fact Tagline:

1. The smallest planet
2. Greatest temperature variation

Description:

1. It is a rocky, metallic planet with no atmosphere
2. Day: 430°C Night: -180°C

Elements

Element	Description	Asset Source/Specs
V	Video of Mercury	Format: MP4 Video size: 1920 x 1080 File size: 12.9 MB

Technical Specification

Phase	Technical Action		Purpose
	Element	Action	

Entrance	V	Play the video	To introduce Neptune visually and create an engaging background for the slide.
	T1	0.50s Dissolve In Transition	To smoothly display the headline and introduce the planet clearly.
	T2	0.50s Fly In Transition	To present the first fact about Neptune in a dynamic way that captures attention.
	T3	0.50s Fly In Transition	To display the second fact.
	D	Appear Transition	To show the diamond directly and be ready before animation and transition process.
		2.00s Custom Path Animation	To move the diamond from Neptune to beside the “Rain” to represent the second fact “Diamond rain” visually.
		2.00s Grow Transition	To enlarge the diamond which emphasizes that the diamond is small compared to Neptune.
	Audio	Play the audio	To simulate Neptune’s strong winds and create an immersive atmosphere for the audience.
Persistence	V	Loop Play: “Until End of Slide”	To maintain continuous visual motion and keep the slide engaging.
	Audio	Loop Play: “Until End of Slide”	To continuously represent the strong winds on Neptune and enhance realism.

4.0 Conclusion

4.1 Conclusion

For this multimedia project, the goal was to create a short documentary style presentation. Therefore, I used Microsoft PowerPoint as the authoring tools to develop the presentation slides. Through this experience, I gained hands on understanding of how to utilise its features to incorporate the five multimedia elements including text, images, animation, audio, and video.

In the slides, text is used to present information in a clear and direct manner. The choice of font and colour are not just for aesthetics, but they play an important role in highlighting key information and guiding the audience's attention. However, excessive text can make the slide look cluttered and difficult to read. Therefore, I used some images to support the content, as a single picture can often convey information more effectively than a long paragraph. For video and animation, they are used to make the content more dynamic and visually engaging, helping to prevent the audience from becoming bored. Audio enriched the experience further by supporting the visuals and enhancing the overall experience. Overall, I learned the importance of balancing aesthetics and information, ensuring that each element serves a purpose instead of being purely decorative.

After the development and preparation of this presentation slides, I gained a practical understanding of how the five multimedia elements work together to convey information effectively. Instead of using them separately, I learned how to combine these elements with the authoring tool in a strategic way to make the content more engaging and easier for the audience to understand. This integration also helped me create a more cohesive and immersive documentary style experience rather than just a normal slide presentation.

4.2 Conclusion

The primary motivation of this project was to create a narrative architecture that conveys these astronomical facts in a storytelling manner. With this motivation in mind, the main goal would be to convey as much information as possible, be it intrinsically or explicitly, in a simple yet attractive manner that does not overwhelm the viewer.

To achieve this goal, the theoretical knowledge learnt about the five multimedia elements was leveraged not just as decorations, but as tools for non-verbal communication. Within each multimedia element, there are a multitude of ways to present them effectively. Beginning with text, the effect of this multimedia element begins with the font choice. I recognised that font choice provides an intrinsic psychological cue to the audience. To illustrate, the font Inter was selected for its clean lines to provide a modern and scientific atmosphere. On the other hand, Times New Roman, while formal, communicates a traditionalist tone that conflicted with the space aesthetic.

Additionally, colours were used strategically to establish a visual hierarchy. In a dark blank slate field with white texts, any colour is bound to stand out, drawing the viewer's attention to key facts instantly. Colours serve as an aid to the audience's personal visual representation of facts presented in text. For example, using an orange colour for Earth's bulge helps the audience to associate colour with a physical concept, improving long-term retention.

By embracing the "Show, Don't Tell" philosophy, animations such as rotation, morphing and zooming help explain scale and motion physically. Instead of describing physical movement in texts, animations are used to allow the viewer to feel the scale of the planets.

Finally, while often overlooked, the inclusion of audio enhances the atmosphere meant to be conveyed. For example, by synchronising a low-frequency hum with the Earth's rotation, the visuals can be grounded with a sense of physical reality.

4.3 Conclusion

This project has helped me understand how to effectively integrate the five multimedia elements including the text, images, animation, audio and video into a presentation. By combining these elements, I was able to create slides that are not only informative but also engaging and visually appealing. I also gained the knowledge of how each element contributes to improving clarity, capturing attention, and enhancing the overall learning experience for the audience.

In addition, this project improved my skills in using Microsoft PowerPoint as an authoring tool. I learned how to utilize its features to integrate different media elements smoothly such as applying animations, adding transitions, and inserting audio and video. This experience helped me understand the importance of using these features appropriately to support the content rather than overwhelm the audience.

Furthermore, I learned the importance of planning and designing slides effectively by using the storyboard. By organizing ideas in advance, I was able to create a more structured and coherent presentation. I also understood how presenting content like a story can make the presentation more engaging and easier for the audience to follow. Overall, this project enhanced both my technical and creative skills in multimedia presentation design.

4.4 Conclusion

Through the development of this multimedia project, I have gained a better understanding of how multimedia elements such as text, images, animation, video, and audio can be integrated effectively to deliver information in a clear and engaging way. I learned the importance of organising content properly so that the audience can easily follow the flow of information.

In relation to the course contents, this project helped me understand how user interface design principles, such as clarity and relevance, play an important role in this project. By carefully selecting appropriate visuals, animations, and audio effects, the presentation can capture the audience's attention while still maintaining meaningful and relevant content.

In addition, I learned how to apply technical design planning, such as storyboard creation and animation settings, to control how elements appear and interact during the presentation. This process improved my ability to design structured multimedia content that combines both visual and interactive elements effectively.

Overall, this project allowed me to apply the concepts learned in the course and develop practical skills in multimedia design, content organisation, and presentation development.
